Project idea 1

OPALÉRA

The house of every gem

Jewellery is part of beauty in this new generation, but buying it may be risky, as you can encounter scams while trying to buy it, for example buying fake diamonds. And it is really expensive for the average human with a basic salary.

This system(OPALÉRA) will try to fix those problems, we will be selling jewellery accessories, this will be mainly Necklaces, earrings and pedants. We will use the E-Business category of Business to Customer (B2C). This Platform will be available for anyone that is trying to buy a jewellery for themselves or loved ones. It will be also available for the jewellery manufacturers to collect data to analyze the most bought items and manufacture more of the favorite products .It will offer a range of items to pick from and will be easy to navigate and get information and details of the items. It will offer cheap prices compared to the other sellers.

What will really set apart is that it will offer a rating system where our buyers will see the experience of others with our website and how the quality of the item was.

We will be using HTML5 for website creation. We will also use programming languages like C#, Java and/or Visual Basic and python for the Database.

Project idea 2

The Drew Atelier

The final project idea is building a system that will sell moisturizer, and it will also fall into the Business to Customer(B2C) category. A lot of people use moisturizers every day. At first glance you may see that its can be sold at stores but with that mind set comes a problem. Everyone has different skin types, some may have smooth skin, and others may have rough skin. Buying the wrong type of moisturizer may cause a skin problem

And that is where our system comes in, it will offer a range of moisturizers in a cheap price and will include a selection area where you will select the type of moisturizer you like and we offer a wide range of moisturizers . Our system can also be used by an Administrator that will remove fake or duplicate listings and monitor reports on the system.

We will be using HTML5 for website creation. We will also use programming languages like C#, Java and/or Visual Basic and python for the Database.

Project Idea 3

AUDIVERSE

FLAGSHIP ATELIER

In our second idea, we will be creating a system that will help users buy earphones. This one will also fall into the E-Business category of Business to Customer(B2C). Over 1 billion people use earphones daily but buying them may be a bit of a problem as you would probably not check the system description of them and buying from someone is also a risk for scams.

That's why AudiVerse is here, it will offer the buyer of information and guarantee safety. And the best one yet, it's also has very prices on our earphones. It really gives the buyer the choice whichever earphone's they want. It offers a Headphones , wireless earphones and different type of them. We offer numerous types of brands and the brands themselves can see which earphones buyers like with our rating system. There is a price distribution graph which will show the most expensive brand.

We will be using HTML5 for website creation. We will also use programming languages like C#, Java and/or Visual Basic and python for the Database.
